

The Excretory System

Doodle Notes

Why is this system Important?

This body system is important because without it wastes would build up in our bodies and we would become sick and possibly die.

Parts Included

Lungs, Skin, Kidneys, Bladder, Ureters,
Liver

Our Body Excretes

Water

Urine

Carbon Dioxide

Heat

The Lungs

Take in oxygen and excrete carbon dioxide

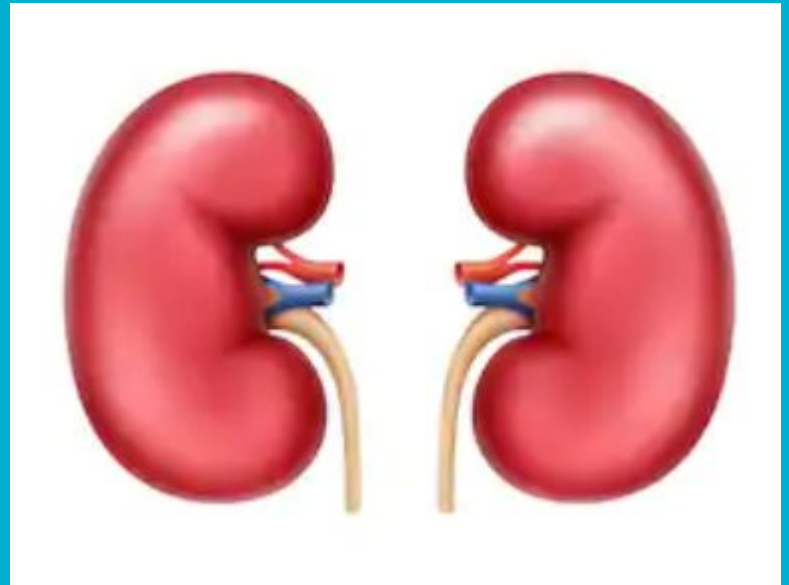

The Skin

Is our largest organ. It excretes perspiration, small amounts of urea and heat.

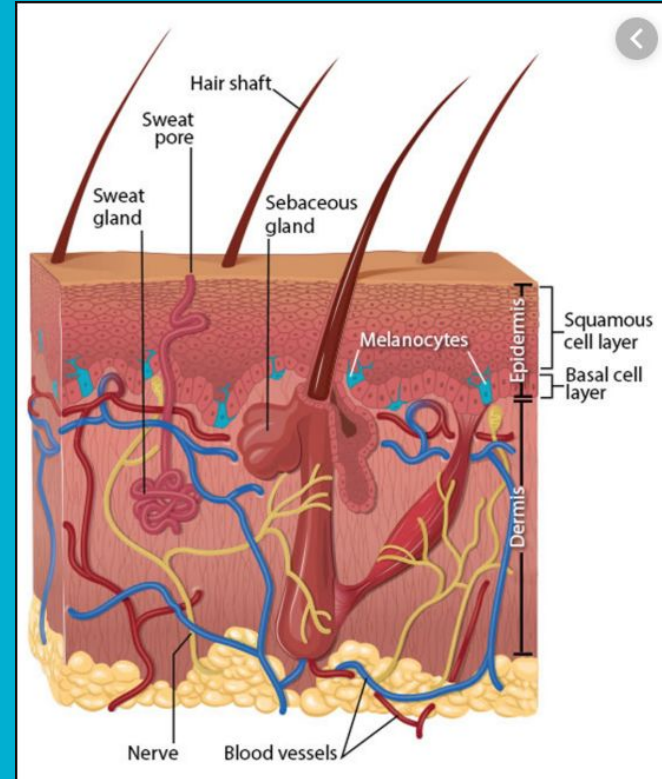

The Kidneys

Filter our wastes from the blood. They excrete urine and heat.

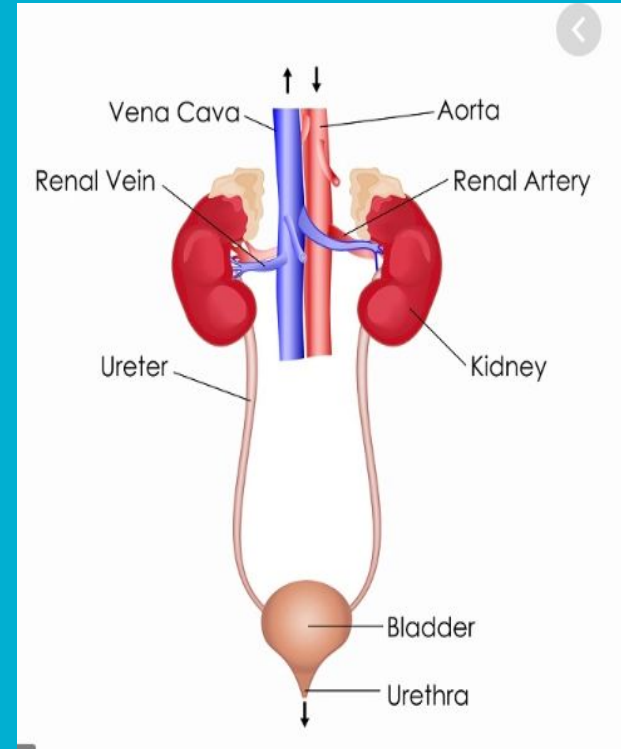

Excretory System

The Skin excretes most of the body's heat and also gets rid of water, salt, and urea.

Kidneys, Ureters, Bladder, & Urethra

Kidneys, ureters, bladder, and urethra work together to filter out wastes from the blood. Urine is excreted. Urine is a mixture of urea, water, and some salts. Heat is also excreted.

Lungs

After we breathe in oxygen, we release carbon dioxide and small amounts of water and heat.
